C.Superfamily: cathelin; cystatin homology
C.Superfamily: cystatin homology cystatin homology cystatin homology cystatin homology cystatin propeptide #status predicted cystolyOpomain: propeptide #status predicted cypoop
F:30-130/Domain: propeptide #status cyperimental cyAT>
F:1148/Product: protegrin 1 #status experimental cyAT>
F:1148/Modified site: amidated carboxyl end (Arg) (amide in mature form from followi
Protegrin : precursor - pig
N;Alternate names: neutrophil peptide 1
C;Species: Sus scrofa domestica (domestic pig)
C;Bate: 19-Oct-1995 #sequence_revision 03-Nov-1995 #text_change 16-Jul-1999
C;Accession: S66284; S45712; S36820; S34585; S57607

NANGOOD

NANGERIA 2 PRECURSOR - pig

N.Alternate names: cathelia-like protein precursor; neutrophil peptide 3
C.Species Sus scrofd demestica (domestic pig)
R.Storici, P.; Zanetti, M.
Blochen Blophys Res. Commun. 196, 1363-1368, 1993
A.Title: A novel CDNA sequence encoding a pig leukocyte antimicrobial peptide with a catherence number: JN0900; MUID:94071898
A.FORDER SUS 1-174 CSTOD
A.MOLECULE CYPE: MRNA
A.MOLECULE CYPE: MRNA
A.MOLECULE CYPE: MRNA
A.MOLECULE CYPE: Primary Structure of three cationic peptides from porcine neutrophils. Sequence
A.MOLECULE CYPE: A.MOLECULE CALL STRUCK A. A. A. Adalasia, K.O.M.A.; Chemushevich, I.V.; Egorov, PEBS Lett. 337, 231-236, 1993

hypothetical protein 447 - actinophage RP3

hypothetical protein 447 - actinophage RP3

c. Species: actinophage RP3

c. Species: actinophage RP3

c. Accession: S53882

R. Gabriel, K.; Schmidt, U.; Rausch, H.

Nucleic Acids Res. 23, 58-63, 1995

A.Title: The actinophage RP3 DNA integrates site-specifically into the putative tRNA(Arg A; Reference number: S53881; MUID:95175370

A. Status: preliminary

A. Status: preliminary

A. Molecule type: DNA

A. Residues: 1-447 <GAB>

A; Title: Complete DNA sequence of a serogroup A strain of Neisseria menigitidis 22491.
A; Reference number: A81775; MUD: 2022556
A; Accession: D81896
A; Status: preliminary
A; Molecule type: DNA
A; Residues: 1-293 < PAR>
A; Residues: 1-293 < PAR>
A; Residues: 1-293 < PAR>
A; Residues: Serogroup A, strain 22491
A; Experimental source: serogroup A, strain 22491

J. Microbiol. 43:315-321(1997).

-!- CATALYTIC ACTIVITY: HYALURONATE = N 3-(4-DEOXY-BETA-D-GLUC-4-ENTRONOSYL)-N-ACETYL-D-GLUCOSAMINE.

-!- SUBUNIT: MONOMER.
-!- SUBURITIAR LOCATION: CELL-ASSOCIATED.
-!- SUBCELLUBAR LOCATION: CELL-RESOCIATED.
-!- SUBLITY: BELONGS TO THE POLYSACCHARIDE LYASE FAMILY 8.
-i- FUNCTION: FUNCTIONS IN THE LET-60 RAS SIGNALING PATHWAY; ACTS DOWNSTREAM OF LET-60 DURING C.ELEGANS VULVAL INDUCTION.
-i- DEVELOPMENTAL STAGE: HIGHEST LEVELS IN EMBRYOS AND LARVAE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         15-DEC-1998 (Rel. 37, Created)

Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents,
                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Linear; tachyplesin; peptide antibiotic; beta-sheet; secondary structure; disulphide bridge; antibody; ribozyme; antitumour agent; antiviral; anti-inflammatory; mammal; cell membrane; passive transport; cytoplasm; nucleus; blood-brain barrier.
                                                                                       This peptide represents a linear derivative of the tachyplesin family of peptide antibiotics. Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the adsulphide bridges. The newel derivatives are used to deliver active agents to an organism. e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                 Gaps

mainto acid sequences in the transmembrane proteins of lentiviruses, in particular HIV and SIV. These peptides comprise arginine rich sequences which, when modelled for secondary structure, display high amphipathicity and hydrophotic moment. Also disclosed are structural and functional analogues and homologues of these peptides which also display antimicrobial activity. The peptides are highly inhibitory to microorganisms (bacteria, fungi, viruses and protozoa) but significantly less toxic to red blood cells and other normal mammalian cells. Activity is demonstrated against Gram positive and negative bacteria including Pseudomonas aeruginosa, Staphylococcus aureus, Enterococcus faecalis and
                                                                                                                                                                                                                                                                          ö
antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antimicrobial; transmembrane protein; TM; lentivirus lytic peptide; LLP; SLP; amphipathic; antibacterial; antifungal; antiviral; antiprotozoal.

The invention relates to new antimicrobial peptides which correspond to amino acid sequences in the transmembrane proteins of lentiviruses, in particular HIV and SIV. These peptides comprise arginine rich sequences which, when modelled for secondary structure, display high amphipathicity and hydrophobic moment. Also disclosed are structural and functional analogues and homologues of these peptides which also display antimicrobial activity. The peptides are highly inhibitory to microorganisms (bacteria, fungi, viruses and protozoa) but significantly is demonstrated against Gram positive and negative bacteria including peeudomonas aeruginosa, Staphylococcus aureus, Enterococcus faecalis and
                                                                                                                                                                                                                                                                                                 Antimicrobial; transmembrane protein; TM; lentivirus lytic peptide; LLP; SLP; amphipathic; antibacterial; antifungal; antiviral; antiprotozoal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Serratia marcescens. The present some of 169 disclosed specific examples of the present sequence is one of 169 disclosed specific examples of the new peptides. It is an analogue of the peptide designated SLP1 (see ARW47616) which is a peptide from the transmembrane protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 45; DB 19; Length 27; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents an antimicrobial peptide of the invention, and used for treating infections caused by Staphylococcus aureus.

Cused for treating infections caused by Staphylococcus aureus.

Cused for treating infections caused by Staphylococcus aureus.

Cused for treating infections caused by Staphylococcus and trusces methicillin resistants. Bedeadomonas aeruginosa, Enterococcus faecalis, S. marcescens Escherichia coli, fungi, protozoca and viruses in acroorganisms such as bacteria, fungi, protozoca and viruses in acroorganisms such as bacteria, fungi, protozoca and oliverse in acroorganisms such as production of recombinant proteins or vectors for particularly for the production of recombinant proteins or vectors for gene therapy. They can also be used in preventing infections through the instruments. The unique structure and to sterilise surgical instruments. The unique structure of these antimicrobial peptides inparts high potency while selectivity is maintained, they are concentrations unlike melittin, a peptide extracted from bee venom, which is highly active against bacteria and lyses red blood cells showing it more difficult for a microorganism to develop a mechanism of the measure concentrations this type of antibiotic. Their small size makes them relatively simple to prepare by standard synthetic peptide chemistry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                  26-JUL-2001
                                                                                         leukaemia.
  This sequence represents an antimicrobial peptide of the invention, and is an analogue of the peptide SLP-1 (see AAY32551). The peptides can be used to treating infections caused by Staphylococcus aureus, methicillin resistant S. aureus, Pseudomonas aeruginosa, Enterococcus aerthicillin resistant S. marcescens, Escherichia coll, fungi, protozoa and viruses in amamalian host. They can be used to inhibit growth of diverse and can be used in tissue culture to inhibit unwanted microbial growth, particularly for the production of recombinant proteins or vectors for gene therapy. They can also be used in preventing infections through the sterilisation of wounds prior to suture and to sterilise surgical instruments. The unique structure of these antimicrobial peptides instruments. The unique structure of these antimicrobial peptides instruments high potency while selectivity is maintained, they are concentrations unlike melittin, a peptide extracted from bee venom, which is highly active against bacteria and lyses red blood cells showing it more difficult for a microorganism to develop a mechanism of relatively simple to prepare by standard synthetic peptide chemistry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervopathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                       á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Krebbers E,

```
The invention relates to new antimicrobial peptides which correspond to particular HIV and SIV. These peptides comprise arginine rich sequences which, when modelled for secondary structure, display high amplicational analogues and homologues of these peptides currentles and functional analogues and homologues of these peptides which also display antimicrobial activity. The peptides are highly inhibitory to microorganisms (bacteria, fungi, viruses and protozoa) but significantly is demonstrated against Gram positive and negative bacteria including peeddomnons aeruginosa, Staphylococcus aureus, Enterococcus faecalis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antimicrobial peptide; LLP1; SLP-1; LLP2; SLP2A; SLP2B; ELP; infection; growth inhibitor; microorganism; virus; gene therapy; vector production; sterilisation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is one of 169 disclosed specific examples of the new peptides. It is an analogue of the peptide designated SLP1 (see AAW47616) which is a peptide from the transmembrane protein of SIV strain MM239.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 44; DB 19; Length 27;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polynucleotide sequences AAC79348-C79375 encode plant viral movement proteins AAB4494-B44520. Some plant viruses have been shown to be able to establish systemic infections via movement proteins that utilise existing plant pathways to traffic macromolecules to surrounding cells. Proteins such as those of the invention are similar to viral movement proteins that function in the transport of nucleic acids from cell to proteins that function in the transport of nucleic acids from cell to cell. The plant viral movement proteins are useful for obtaining a uncleic acid fragment encoding a viral movement protein. Polynucleotides calcular biology, and in the preparation of antibodies against the plant molecular biology, and in the preparation of antibodies against the proteins. The proteins are useful in the field of proteins. The proteins are also useful for isolating cDNAs and genes encoding homologous proteins from the same or other plant species, and to correate transgenic plants in which the protein is presented at higher or lower levels than normally found. The proteins and nucleotide sequences may be used to control cosuppression and engineer plant virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel viral movement polypeptides and polynucleotides useful in field of plant molecular biology, for producing transgenic plants, to prepare antibodies and in immunological screening of CDNA expression libraries

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               δy
0
                                                                                                                                                                                                                                                                                                          particularly for the production of recombinate proteins or vectors for gene therapy. They can also be used in preventing infections through the sterilisation of wounds prior to suture and to sterilise surgical instruments. The unique structure of these antimicrobial peptides imparts high potency while selectivity is maintained, they are moderately haemolytic but only lyse red blood cells at high concentrations unlike melittin, a peptide extracted from bee venom, which is highly active against bacteria and lyses red blood cells showing little selectivity. The peptides target a membrane structure which makes it more difficult for a microorganism to develop a mechanism of resistance against this type of antibiotic. Their small size makes them relatively simple to prepare by standard synthetic peptide chemistry.
                                                                                                                                                                                                            This sequence represents an antimicrobial peptide of the invention, and is an analogue of the peptide SLP-1 (see AAY32551). The peptides can be used for treating infections caused by Staphylococcus aureus, methicillin resistant S. aureus, Pseudomonas aeruginosa, Enterococcus faccalis, S. marcescens, Escherichia coli, fungi, protozoa and viruses in a mammalian host. They can be used to inhibit growth of diverse microorganisms such as bacteria, fungi, protozoa and DNA and RNA viruses and can be used in tissue culture to inhibit unwanted microbial growth,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; primer; detection; diagnosis; antisense therapy; gene therapy.

the present invention describes primer sets. It symmetries to comprises: (a) an oligo-dr primer and an oligonucleotide complementary strand of a polynucleotide which comprises one of the complementary strand of a polynucleotide which comprises one of the comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 3'-end sequence and an oligonucleotide comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the coligonucleotide which comprises a 3'-end sequence, where the coligonucleotide comprises a 1 least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and the specification. The primers are used in antisense therapy and the comprises of the abnormality of the proteins encoded by certain and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the connection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs assily without any specialised methods. AAH03166 to AAH1363 and AAH3633 represent human amino acid sequences; and AAH1363 to AAH13632 correspond to the full of which are used in the exemplification.
                                                                                                                                                                                                                                                                                                                                                                   Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                         Yamamoto J;

                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                             The present sequence represents a murine cholesterol 25-hydroxylase polypeptide. The polypeptides and polynuclectides can be used to regulate cholesterol 25-hydroxylase activity and therefore serum cholesterol in a mammalian host. The polypeptides, polynucleotides and the cholesterol 25-hydroxylase-specific binding agents are useful in diagnosis (e.g. genetic hybridization screens for cholesterol 25-hydroxylase transcripts), therapy (e.g. cholesterol 25-hydroxylase inhibitors to modulate serum cholesterol) and in the biopharmaceutical industry (e.g. as immunogens, reagents for isolating natural 25-hydroxylase genes and transcripts, reagents for screening chemical libraries for lead pharmacological agents).
                                                                                              New cholesterol 25-hydroxylase polypeptides, useful for regulating cholesterol 25-hydroxylase activity and therefore serum cholesterol in a mammallan host, have cholesterol 25-hydroxylase-specific structure
                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New peptide derivs. of tachyplesin - having antimicrobial activity, used against plant pathogenic fungi or human or animal infections

Sequences AAY69610-Y69611 and AAY69617 represent tachyplesin analogues used in an exemplification of the present invention, in which the native tachyplesin cysteine residues are replaced with Ala, Leu and Asp, respectively. Tachyplesin (AAX69608) is a naturally occurring antimicrobial peptide which contains two disulphide bonds which halp to maintain its tertiary structure. The invention relates to novel peptide analogues of tachyplesin (Y69612-AAX69614, AAX69616) in which the cysteine residues at positions 3, 7, 12 and 16 of the native tachyplesin are replaced by the hydrophobic amino acids isolaucine, valine, methionine, phenylalanine or tyrosine, the same amino acid being
AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab hosenocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungl, in particular for fungl pathogenic to plants e.g. Fusarium graminearum, Fusarium monilforme, Sclerotinia scleroticum, sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New tachyplesin analogs useful for controlling fungal and bacterial activity in agricultural and medical applications and for controlling plant viruses have four cysteine substitutions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  amino acid sequences in the transmembrane proteins of lentiviruses, in which, when modelled for secondary structure, display high amphich, when modelled for secondary structure, display high amphicative and hydrophobic moment. Also disclosed are structural and functional analogues and homologues of these peptides which also display antimicrobial activity. The peptides are highly inhibitory to microorganisms (bacteria, fungi, viruses and protozoa) but significantly less toxic to red blood cells and other normal mammalian cells. Activity is demonstrated against Gram positive and negative bacteria including Pseudomonas aeruginosa, Staphylococcus aureus, Enterococcus faecalis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antimicrobial; transmembrane protein; TM; lentivirus lytic peptide; LLP; SLP; amphipathic; antibacterial; antifungal; antiviral; antiprotozoal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to new antimicrobial peptides which correspond to
present at all four positions. Despite being unable to form intramolecular disulphide bonds, the analogues are functional as antimicrobial agents. The tachyplesin analogues are useful for controlling fungal and viral activity in agricultural and medical applications and for controlling plant viruses. They can also be expressed in transgenic plants, preferably wheat, sorghum, sunflower, soya or especially maize plants to provide resistance to pathogenic finand viruses. Note: The present sequence is not shown in the specification, but is derived from the generic tachyplesin analogue sequence given in column 23.
                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is one of 169 disclosed specific examples of the new peptides. It is an analogue of the peptide designated SLP1 (see AAW47616) which is a peptide from the transmembrane protein of
